Thick cylinders & discs

Thick cylinder

Rotating disc with thermal gradient

$$\begin{split} &\sigma_r\!=\!A\!-\!\frac{B}{r^2}\!-\!\frac{(3\!+\!\nu)}{8}\rho\omega^2r^2\!-\!\frac{E\alpha}{r^2}\int Tr\;dr\\ &\sigma_\theta\!=\!A\!+\!\frac{B}{r^2}\!-\!\frac{(1\!+\!3\nu)}{8}\rho\omega^2r^2\!+\!\frac{E\alpha}{r^2}\int Tr\;dr\!-\!E\alpha T \end{split}$$

If the shaft is solid, $r_i = 0$ and

$$p = \frac{E\delta_r}{2R} \left[1 - \frac{R^2}{r_o^2} \right]$$

 r_o

The press fit has no axial pressure, so $\sigma_l = 0$, and it is a biaxial stress condition.

The circumferential strain $\varepsilon_c = \frac{\sigma_c}{F} - \frac{v \sigma_r}{F}$

which equals the radial strain (because C = $2\pi r$).

Because the radial change $\delta = R \epsilon_r$, we get the increase in Inner Radius of the outer member (hub):
